

ABSTRACT OF THE DISCLOSURE

An interface device coupled to a board on which integrated circuits are mounted for providing electrostatic discharge protection for the integrated circuits that comprises a plurality of first contact members, each of the first contact members including one end connected to the board and the other end to connect to an external device, and at least one second contact member connected to a voltage line of a voltage level, wherein the at least one second contact member includes a length greater than that of each of the first contact members.
